

## resin injection

Resin injection techniques have proved to be a valuable ally in the repair and conservation of stone, concrete and brick over the past decade. Although they number among the 'new technologies' towards which purist preservationists are often hostile, they can be used to achieve spectacular repairs, knitting together fragile and fractured structures where the only alternative would be total renewal with its great expense, disruption to use and destruction of aesthetic harmony.

In addition to the use of epoxy resins, there are also a number of flexible polyurethane resins available which are used where a greater degree of movement is expected in the structure. These resins are not structural as such but successfully re-bond crack or joint interfaces, thus preventing water or gas entry into or out of a structure.

Metropolitan Stone has considerable experience in a variety of injection techniques which are used to re-bond delaminated floor screeds and cracks in render, masonry and concrete.

Stone Cleaning • Restoration • Marble Maintenance • Concrete Repair

Supply & Fixing of Natural & Pre-Cast Stone

Supply & Fixing of Marble/Granite/Terrazzo

Repairs to Cornices, Soffits & Ashlar Stone
